

UNIX has long been the operating system of many server and application environments in companies worldwide. This comprehensive hands-on course provides users the knowledge and skills needed to effectively use Unix. In this course you will learn how to use Unix user commands and develop shell scripts. This is also a first course for system administrators and programmers who are new to Unix and Linux.

**Course Objectives:**

- Manage files and directories: create, copy, rename, remove, edit, and perform other operations.
- Create and modify files using the vi editor.
- Use many UNIX utilities for text file manipulation, personal workspace management, file system management, and communication with other users.
- Take advantage of UNIX security mechanisms to protect files and programs from unauthorized access and to configure shared access among work groups.
- Use the UNIX shell (command interpreter) to control the flow and processing of data through pipelines.
- Increase your productivity by generating file names using “wild card” pattern matching.
- Look up commands and other information in the on-line UNIX reference manuals.
- Explain the purpose of shell programs.
- Recognize applications for shell programs.
- Design and write shell programs of moderate complexity.
- Manage multiple concurrent processes to achieve higher utilization of UNIX.

**Audience:** End-users and programmers who are new to the UNIX environment.

**Prerequisites:** None

**Number of Days:** 4 days

<p><b>1 Course Introduction</b>          Course Overview          Course Objectives          Suggested References</p> <p><b>2 Getting Started</b>          What is UNIX?          A Brief History of UNIX          Logging In          Logging Out          Try a Few More Commands          Changing Your Password          Using Online Manuals</p> <p><b>3 The File System – Files</b>          What is a File?          The ls Command</p>	<p><b>4 The File System – Directories</b>          Hierarchical File System          Pathnames          The pwd Command – Print Working Directory          The cd Command – Change Directory</p>
--	--

	The mkdir Command – Make Directories		The script Utility
	The rmdir Command – Remove Directories		The clear Utility
	The cp Command (again) – Copy Files		The at Utility
	Two useful directory names – . and ..		The crontab Utility
<b>5</b>	<b>Editing With vi</b>	<b>8</b>	<b>Text Handling Utilities</b>
	What is vi?		The grep Utility
	The vi Buffering Process		The tr Utility
	Command Mode and Insert Mode		The cut Utility
	Modes Diagram		The paste Utility
	Getting Started		The sort Utility
	Moving the Cursor Around		The wc Utility
	Inserting Text	<b>9</b>	The diff Utility
	Deleting a Character or Line		The lp Utility
	Undo Last Command	<b>9</b>	<b>File System Security</b>
	Opening a New Line		File Permissions
	Save Your Work or Abort the Session		The chmod Utility
	Review of vi Commands		Directory Permissions
<b>6</b>	<b>More Editing With vi</b>	<b>10</b>	The umask Command
	Scrolling the Buffer		<b>File System Management Utilities</b>
	Cursor Motion Commands – w, W, b, B, e, E		The find Utility
	Cursor Motion Commands - \$, ^, 0, G		The df Utility
	Cursor Motion Commands – f, t, F, T		The du Utility
	Delete Operator - d		Compressing Files
	Change Operator - c	<b>11</b>	The ln Utility
	Yank Operator - y		The ulimit Utility
	Put Commands – p, P	<b>11</b>	The tar Utility
	Searching For a Pattern - /, n, N, ?		<b>Communication Utilities</b>
	The join Command		The write and talk Utilities
	The file Command - :f		The mesg Utility
	Edit file Command - :e	<b>12</b>	Mail Overview
	Cut and Paste Between Files		The mail Utility
	Read file Command - :r		The mailx Utility
	Set options Command		<b>Using the Shell</b>
	Set options Command - .exrc file		What is a Shell?
<b>7</b>	<b>Personal Utilities</b>		Which Shell?
	The date Utility		The Command Line
	The bc Utility		Standard Input, Standard Output and Standard Error
	The expr Utility		Using Default Standard In and Standard Output
	The cal Utility		I/O Redirection
	The news Utility		Appending Output of a File
	The id Utility		Pipes
	The uname Utility		The tee Utility
	The finger Utility		

<b>13</b>	<b>Filename Generation</b>	The ? special Character The * special Character The [ ] special Characters The ! special Characters	Editing and Re-executing Commands Aliases
<b>14</b>	<b>UNIX Processes</b>	What is a Process? Process Structure The ps Utility Options to the ps Utility Background Commands (&) Killing Background Processes Redirecting the Standard Error	
<b>15</b>	<b>Shell Programming Concepts</b>	What is a Shell? What is a Shell Script? Why Use Shell Scripts?	
<b>16</b>	<b>Flow Control</b>	The Exit Status of Commands Command Line Examples The test Command The if-then-else Construct The elif Construct A loop Example	
<b>17</b>	<b>Variables</b>	Aliases User Created Variables The read Command The Shell Environment The export Command Sub-shells Command Substitution Quoting Mechanisms Assigning Variables – Summary	
<b>18</b>	<b>Special Variables</b>	Command Line Arguments \$# - Number of Arguments The shift Command \$* - All Arguments \$\$ - PID of Shell	
<b>19</b>	<b>More Flow Control</b>	The for Loop The while Loop The Case Construct	
<b>20</b>	<b>Appendix – Korn shell features</b>	Viewing your Command History
