

This three-day intensive course teaches the essential elements of ADO.NET for Web applications such that at the end of the course the programmer is able to utilize its tremendous database manipulation powers to build effective database applications. The course includes a major case study demonstrating the use of ADO.NET in a realistic setting. It is current to .NET 4.5.1, Visual Studio® 2013 and SQL Server® 2012 Express. The course opens with an overview of ADO.NET and its relation to previous Microsoft data access technologies. It includes a discussion of ADO.NET architecture, main interfaces and classes, and programming with both the connected and disconnected models. The database for the case study is introduced. The next two chapters cover in detail Connection and Command objects, which are essential in both connected and disconnected database access scenarios. The following chapter covers DataReaders, which provide a fast, forward-only reading capability. Programming with DataReaders bears a close resemblance to programming with the vintage recordset object. Then the course focuses on the backbone of ADO.NET: DataSet and its related classes, such as DataAdapter, DataTable, DataRow, DataColumn, DataRelation, TableMappings and ColumnMappings. DataSet is able to handle multiple tables while remaining disconnected. It is eminently suited for building highly scalable applications for the Web. The close relationship between ADO.NET and XML is covered in detail. Transactions and concurrency are covered.

Course Objectives:

- Understand the architecture and main classes of ADO.NET
- Gain fluency in programming ADO.NET using C#
- Gain a thorough understanding of the use of disconnected DataSets for building highly scalable applications
- Acquire a working knowledge of the tight coupling of XML with ADO.NET
- Learn how to use newer features in ADO.NET, including asynchronous operations, multiple active result sets, and bulk copy
- Acquire a working knowledge of LINQ and the Entity Framework
- Implement a realistic case study that ties together many concepts of ADO.NET in a practical demonstration

Audience: Programmers with a working knowledge of C# who want to build Web applications using .NET and the C# language.

Prerequisites: A basic knowledge of SQL and of programming the .NET Framework using C#. The student should also understand the fundamentals of XML. To get full benefit from the examples in the course the student should be able to write simple Web Forms applications. A working knowledge of SQL Server is also desirable.

Number of Days: 3 days
